

# Lenticular Printing

I came across [this youtube video](#) and I thought it would be pretty neat to do something like this. Naturally, there's probably a more elegant way of doing things using the command line.

## Notes

Ideally a printer with enough LPI.  $600 \text{ lpi print} / 50 \text{ lpi sheet} = 12 \text{ lines per lenticule}$ . Each sheet is 5 x 7 in

Use imagemagick to interlace <https://imagemagick.org/script/command-line-options.php#interlace>

```
magick input.png -resize <full_width>x<height> output.png
magick -background none output.png -crop <strip_width>x<height> output_%d.png # cut image into full_width
/ strip_width amount of images
magick -background none output_* +append output_interlaced.png # append images horizontally

# For 6 frames per lenticule, strip size = full_width/lens lpi/6
magick input.png -resize 600x300 output.png
magick -background none output.png -crop 2x300 output_%d.png # outputs 300 images!
# Then, keep only every `i`th image, where i is the frame sequence number
# TODO
```

## To-Do

- Setup a print server and print something using `lp`
